An Exploratory Study of Movie-Induced Tourism: A Case of the Movie *The Sound of Music* and Its Locations in Salzburg, Austria

Holly Hyunjung Im
Kaye Chon

ABSTRACT. Although it has been acknowledged that movies can induce people to travel to the sites where the movies were filmed, there is still little research related to behavioral characteristics of tourists who actually visit different movie sites. The purpose of this study was to explore a relationship between a movie and its effect on the local tourism where the movie was filmed. In this study, specifically, the movie *The Sound of Music* was chosen to examine the role that the movie played in attracting people to Salzburg, Austria that was used as a backdrop for the movie. The results of the survey have supported the phenomenon of movie-induced tourism by showing that the movie *The Sound of Music* influenced visitors in selecting the film locations as their travel destination.

KEYWORDS. Movie-induced tourism, travel decisions, *The Sound of Music*

INTRODUCTION

Movies are creating tourist destinations (Heavens, 1995). There are several examples to support this growing phenomenon of movie-induced tourism. After the movie *The Bridges of Madison County* hit the box-office, Madison County in Iowa was swamped with visitors who wished to trace the romance between Clint Eastwood and Meryl Streep. The State of Iowa was another setting for the movie *Field of Dreams*, which made hundreds of people flock to the cornfields of Dyersville, Iowa, just to see the farm with a baseball field appeared in the

movie (Keeble, 1999). The Oscar-winning movie *Dances with Wolves* has also brought thousands of tourists to the Black Hills areas of western South Dakota where Kevin Costner's camera focused on the region's natural wonders (Burko, 1992).

Why do movies lure people to travel to film locations? Since Riley and Van Doren's 1992 study on movie-induced tourism, numerous articles have attempted to explain reasons for the popularity of film locations as visitor destinations (i.e., Beeton, 2000; Butler, 1990; Busby and Klug, 2001; Kim, Cho, and Baik, 2006; Kim and Richardson, 2003; Riley, Baker, and Van Doren, 1998;

Holly Hyunjung Im, Ph.D., is an Assistant Professor in the College of Culture and Tourism of the Department of Hotel Management at Jeonju University (Hyoju-dong, 3Ga 1200, Jeonju, 560-759, South Korea) (E-mail: hollyim@jj.ac.kr).

Kaye Chon, Ph.D., is Chair Professor and Director in the School of Hotel and Tourism Management at The Hong Kong Polytechnic University (Hung Hom, Kowloon, Hong Kong) (E-mail: hmkchon@polyu.edu.hk).

Tooke and Baker, 1996; Winsa 1999). Although these studies have explained various aspects of the movie-induced tourism, there is still little research related to behavioral characteristics of tourists who actually visit different movie sites (Busby and Klug, 2001). The objective of this study was to provide further evidence that film causes tourists flock to the movie locations by conducting an on-site survey at one of the well-known film sites. In this study, the movie *The Sound of Music* was chosen and the on-site survey was administered targeting visitors to Salzburg, Austria that was used as a backdrop for the movie, in order to explore the role that the movie played in attracting people to Salzburg. Salzburg, Austria once was famous throughout the world as the birthplace of Mozart and the site of an important annual music festival (Harris, 1984). However, with the appearance in 1965 of the successful movie *The Sound of Music*, *The Sound of Music* Tour has been the most popular tour in Salzburg, Austria (Kim et al. 2006). The specific objectives of this study were as follows: 1) Who are the movie-induced tourists and what are their travel characteristics?; 2) Does the movie *The Sound of Music* influence in visitation decisions?; 3) Does the frequency of watching the movie affect the level of visitation decisions?; 4) What is a relationship between travel characteristics and visitation decisions with demographic groups?; and 5) What is a visitor's degree of involvement with his or her visit to the movie sites?

LITERATURE REVIEW

Among the existing research publications on movie tourism, benefits contributed by film tourism to a destination or tourists is one of the most popular research topics (Lam and Ap, 2006). The benefits generated from film tourism are often measured by the number of visitors in a particular location where the movie was filmed (Riley and Van Dore, 1992; Riley et al., 1998; Macklin, 1999; Tooke and Baker, 1996; Winsa, 1999). For

example, Riley and Van Doren (1992) have gathered data for several movie locations in the United States that had experienced a significant increase in terms of number of tourists after those places were used as a backdrop in the motion picture films (movies). Among them, the movie *Close Encounters* provided the most impressive evidence of visitors increase. The data provided by Riley and Van Doren (1992) showed a great change in number of visitors to, where the film's major scenes were shot, after the release of the movie in 1977. The increases in visitor number associated with film and TV mini-series can be also found in England. Winsa (1999) stated that film and television portrayals of London are estimated to encourage the arrival of nearly one in five of the 13 million foreign tourists who visit the capital each year. Some spots, where movies have been made, have doubled the number of visitors as a result (Macklin, 1999). Encouraged by this growing popularity of movie-induced tourism, the British Tourist Authority (BTA) has created a Movie Map that shows the locations for such films as *Shakespeare in Love*, *Pride and Prejudice*, *The Full Monty*, and *Harry Potter*.

At some locations, the impact of increased tourism has created economic windfalls, while at others it has caused safety concerns and overcrowding. In most cases the residents were not prepared for the influx of people or for their unceasing curiosity (Riley et al., 1998). In case of Madison County, Iowa, there were few commercial accommodations and little infrastructure to handle tourists because of its remote location. Beeton (2000) argued that an influx of visitors is not always welcome or advantageous, with many country towns unsuited to supporting the concomitant tourism growth because of limited infrastructure, facilities and services. In most cases the local community did not seek to be the site for the filming, yet they are left to cope with the consequences of increased traffic, crowding and pollution. Additional problems arise when the geographical details of the films

are frequently invented along with the storyline. Tourists who wish to travel inland from Omaha Beach, following the path of Hanks and his men as they try to find Private Ryan, to find that most of the film for *Saving Private Ryan* was shot on the coast of Ireland and in Hatfield, Hertfordshire and not at St. Laurent in France (Keeble, 1999). The question as to what drives people to visit film locations has been raised by several researchers (Keeble, 1999; Riley et al., 1998). Riley et al. (1998) classified various types of attractions in the movies by adopting 'icons,' a focal point which lures viewers to a location shown in the movie. By using the word 'icon,' it was implied that a movie's symbolic contents, a single event, a favorite actor, a location's physical features or a theme can represent all that is popular and compelling about a movie. Some locations attracted people because of their natural scenery (e.g., *A River Runs Through It* and *The River Wild*), while others just happened to be the site where the theme or event took place (e.g., *Steel Magnolias* and *Fried Green Tomatoes*). Keeble (1999) argued that people want to experience again the emotions they experienced in the cinema – of fear, courage, fraternity, etc. and the fiction of the film had made the location all the more appealing. Women gather at Arches National Park in Utah, where *Thelma and Louise* drove off the cliff, to share a sense of 'self-empowerment,' while men head to Kakadu National Park in Northern Australia to experience the 'outback machismo' of Paul Hogan in *Crocodile Dundee* (Keeble, 1999).

The effects of movie tourism in the context of destination image have been discussed by Kim and Richardson (2003). They employed two components of destination images, the cognitive and affective images, to investigate influences of a popular motion picture on viewers' perception of the depicted place, as well as familiarity and interest in visiting. It was concluded that a motion picture could be an effective tool to change place images and affect the audiences' interest in visiting the place.

Similar study has been conducted by Warnick, Bojanic, and Siriangkul (2006) to examine the effect of a movie on the image of Thailand among student travelers. The results indicated that college students did not appear to consider viewing a movie as an important factor that actually encourages them to visit the filmed location.

METHODS

The questionnaire was developed in an effort to identify influence of the movie *The Sound of Music* in travel decisions and other study objectives. The first draft of the questionnaire was circulated to a panel of six expert judges for feedback regarding wording, layout and comprehension of the questionnaire items. The final version of the survey instrument of the study comprised four parts. In Part I, five variables were used to identify the impact of the movie with visitors' travel characteristics and obtain his or her degree of satisfaction about the tour. Items were as follows: (1) the primary purpose of your current visit to Salzburg (purpose); (2) most wanted place to visit in Salzburg (place); (3) frequency of watching the movie *The Sound of Music* (frequency); (4) information source (source); and (5) most expected part from 'The Sound of Music Tour' (expect). To measure the visitors' overall satisfaction with 'The Sound of Music Tour,' a non-verbal graphic scale with a continuum of 0 (not at all satisfied) to 100 (totally satisfied) with 50 (mixed feelings) in the middle (Chon, 1990). Part II was to measure the effectiveness of the movie *The Sound of Music* in visitation decisions on a five-point scale with one being "strongly disagree" and five being "strongly agree." The items relating to travel decisions were: (1) After watching the movie, I have always wanted to visit the locations where the movie was filmed (want); (2) The movie has influenced me to visit Salzburg (influence); (3) Once I had seen the movie, I had to come to Salzburg (come); and (4) 'The Sound of music Tour' today increased my

interest in a future revisit to Salzburg (intention). In Part III, the Personal Involvement Inventory (PII) was adopted to measure a visitor's degree of involvement with his or her visit to the movie sites. The PII, originally developed by Zaichkowsky (1985), is a twenty-item scale requiring the respondent to indicate his or her feelings with regard to importance, desirability, relevance, etc., of the product to him or her, with each item being measured on a seven-point semantic differential scale. Part IV dealt with respondents' profile to provide more information about the characteristics of the visitors.

Questionnaires were randomly distributed to 500 individuals, who participated in 'The Sound of Music Tour' in Salzburg, Austria. To make the sample more generalizable, an effort was made to give the survey at different hours on different weekdays and weekends. The subjects for this survey were limited to those who can understand the questions in English. Of the 500 distributed questionnaires, 329 were collected and after eliminating the unusable responses, a total of 314 responses (response rate of 63%) were coded for data analysis.

RESULTS

Demographic Profiles of Respondents

Table 1 presents the demographic characteristics of visitors who have participated in 'The Sound of Music Tour.' The majority of respondents (68.1%) were female visitors and all age categories were represented in relatively equal proportions with age group of '20–30' being slightly higher proportion (28.3%) than other age groups. The majority of respondents tended to have fairly high education levels with about 71 percent holding 'college degree and above' (35.2%) or 'professional degrees' such as law, medical, and optometry (35.6%). Over half (53.2%) of respondents had an annual income ranged between 'US\$29,999 and US\$50,000,' whereas the respondents with

annual income of 'US\$70,000 and above' were about 35 percent (34.7%). The most frequently reported occupation by the respondents was professional/executives (33.8%) and the largest proportion of the respondents (38.5%) resided in North America including Canada, USA, and Mexico, followed by the residents in Oceania region, mainly Australia and New Zealand.

Travel Characteristics of Visitors

The majority of respondents (76.8%) were found to be first-time visitors to Salzburg, Austria and they were likely to visit Salzburg for pleasure (79.3%) whereas about 10 percent (10.2%) of people specifically indicated that they came to Salzburg to see the locations where the movie *The Sound of Music* was filmed. When the respondents were asked which place they most wanted to visit in Salzburg, the answers were: 'the film locations of the movie *The Sound of Music* (41.4%), 'castles and fortresses' (21.0%), 'mountains/lakes/parks' (20.0%), 'Mozart House' (7.6%), and 'others' (8.6%). Regarding frequency of watching the movie, the majority of respondents (71.0%) indicated between '1–10 times' (58.3%) and '11 times and above' (12.7%), whereas 29 percent of the respondents reported that they had not seen the movie at all. In planning a trip to Salzburg, the movie *The Sound of Music* was likely to be the most influential information source (42.7%), an indicative of impact of the movie in inducing tourists to Salzburg. Tour guidebook (18.5%) and travel agency (16.7%) were the second and third information source used by the respondents. In terms of evaluation of the trip to the film locations, the majority of the respondents (85.4%) reported that their actual experience was about what they had expected (51.1%) or exceeded their expectation (34.3%). Likewise, about 78 percent (78.2%) of the respondents were satisfied with the trip to the film locations. A summary of travel characteristics of the respondents is shown in Table 2.

TABLE 1. Demographic Profiles of Respondents

Variables	%	Variables	%

Student	13.4	Oceania (Australia and New Zealand)	21.2
Retired	12.5		
Sales/manager	9.7		
Others	8.3		

Influence of the Movie The Sound of Music on Travel Decisions

In determining whether the movie *The Sound of Music* influences travel decisions, frequency of watching the movie was compared with several variables relating to travel decisions. The results suggested that the movie did influence respondents' decision level in visiting Salzburg. Respondents tended to agree that the movie 'has influenced me to visit Salzburg' (mean=3.45) and 'increased my interest in a future revisit to Salzburg' (mean=3.72). They also indicated that 'After I had seen the movie, I have always wanted to visit the film locations' (mean=3.63) and 'Once I had seen the movie, I had to come to Salzburg' (mean=3.68). One-way ANOVA was used to further explore the relationship between the frequency of watching the movie and the level of travel decisions (Table 3). Follow-up tests using post-hoc Duncan test were also used to examine the source of differences across the respondent subgroups. It was discovered that there were differences between the three groups for all of the four

variables at $p<.001$. Group three (six times and above) reported the highest mean scores for three variables (want, come, and intention), showing significant mean differences from those of the other two groups. Group two (1–5 times) indicated the highest mean scores in 'influence.' On the other hand, respondents who had not seen the movie indicated the lowest scores in all of the four variables.

A multiple regression analysis was performed to determine whether travel characteristics in association with the movie factor influence the respondents' intention to revisit Salzburg. Two common measures, tolerance values and variance inflation factor values (VIF), were employed for multicollinearity issue. The results showed that tolerance values were higher than 0.60 with VIF values being quite close to 1.00, indicating very low levels of collinearity. Respondents' intention to revisit (the criterion variable) was simultaneously regressed on the set of six predictors of travel characteristics; 'purpose,' 'visit,' 'source,' 'place,' 'frequency,' and 'expect.' According to Table 4, travel characteristics such as 'source,' 'place,' and

TABLE 2. Travel Characteristics of Visitors

Variables	%	Variables	%
What is the primary purpose of your current visit to Salzburg?		Which of the following is the place you most wanted to visit in Salzburg?	
Pleasure(vacation) trip	79.3	Mozart House	7.6
To visit friends/relatives	1.6	The locations of the movie	41.4
To attend a conference/meeting	1.9	Castles and Fortresses	21.0

Travel decisions	Frequency of watching the movie				p
	None (G1)	1–5 times (G2)	6+times (G3)	F	
After watching the movie "The Sound of Music," I have always wanted to visit the locations where the movie was filmed (WANT)	3.26 ^a	3.50 ^a	4.10 ^b	14.46*	.000
The move has influenced me to visit Salzburg* (INFLUENCE)	2.98 ^a	3.92 ^c	3.39 ^b	21.42*	.000
Once I had seen the movie, I had to come to Salzburg* (COME)	3.10 ^a	3.64 ^b	4.22 ^c	26.26*	.000
"The Sound of Music Tour" today increased my interest in a future revisit to Salzburg* (INTENTION)	3.09 ^a	3.65 ^b	4.35 ^c	33.04*	.000

Notes: * $p<0.001$

a, b, c indicate the source of significant differences ($a<b<c$)

TABLE 4. Relationship between Intention to Revisit and Travel Characteristics

Independent Variables	Beta	t-value	p-value
Primary purpose of visit to Salzburg (purpose)	0.02	0.43	0.665
Number of times to visit Salzburg (visit)	-0.20	-0.39	0.696
Information Source (source)	-0.17	-3.40*	0.001
The most desired place to visit in Salzburg (place)	0.14	2.62*	0.009
Frequency of watching the movie (frequency)	0.32	4.94*	0.000
The most expected thing from today's tour (expect)	-0.04	-0.77	0.433

Notes: Adjusted $R^2=0.24$; Tolerance values >0.60 , VIF values <1.0

* $p<0.001$

noted that R^2 for the multiple regression analysis was statically significant, explaining about 24 percent of the total variance in intention to visit.

Independent sample t-test was performed to compare differences between those who had seen the movie (movie-watcher) and those who had not seen the movie (non-watcher) in travel characteristics and travel decisions. The differences in four variables relating to travel decisions were tested for the two groups and only one variable 'intention to revisit' was found to be significantly different with the movie watchers ($p=0.008$) (Table 6). Among the six travel characteristics, three variables ('purpose,' 'place,' and 'expect') indicated significant differences in the movie watchers with higher mean scores than non-watchers.

Comparison of Travel Characteristics and Travel Decisions with Demographic Groups

A series of ANOVA with post-hoc Duncan multiple range tests was assessed to identify significant differences in travel characteristics and travel decisions with various demographic groups (age, income, education, origin of residence). The results presented that only two demographic groups, age and origin of residence, differed significantly with respect to travel characteristics (Table 6). The post-hoc tests identified respondents in the age group of '61 and above' showing significant mean differences from other age groups in travel characteristics such as 'place' and 'expect.' Respondents from Oceania region showed

Note: * significantly different at $p < 0.05$; ** at $p < 0.001$.

a, b, c indicate the source of significant differences (a < b < c)

highest mean score in 'primary purpose of trip to Salzburg' (purpose). Finally, among demographic groups, only age group was found to be different across all but one of the variables relating to travel decisions with the age group of '61 and above' being the highest mean scores. The only non-significant variable was 'After watching the movie, I have always wanted to visit Salzburg' (want).

The Personal Involvement Inventory (PII)

Zaichkowsky (1985) suggests that low involvement is found in a score ranging from 20 to 69; medium scores: 70 to 110; and high scores: 111 to 140. The PII score is computed as follows: for low involvement, scores from 1.00×20 to 3.45×20 (20 to 69); medium involvement, 3.5×20 to less 5.5×20 (69 to 110); high involvement from 5.55×20 to 7.0×20 (111 to 140).

The PII data indicated that the respondents' degree of involvement fall into the medium range (mean=109.78). Table 7 illustrates the means of each involvement item with average scores. The means for the 'important/unimportant' (mean=6.26) and 'appealing/unappealing' (mean=5.90) items received highest means which may indicate that these items are relevant to the

respondents' interest in the film sites. Likewise, it would seem that the constructs such as 'trivial/fundamental' (mean=4.74) and 'does not matter/matters to me' (mean=4.40) in the PII scale are least

TABLE 7. A Summary of the PII levels of Involvement

Involvement Items	Means	SD
Unimportant vs. Important	6.26	1.00
Of no concern to me vs. of concern to me	5.90	1.03
Irrelevant vs. Relevant	5.54	1.01
Means nothing to me vs. Means a lot to me	5.73	1.22
Useless vs. Useful	5.38	1.24
Worthless vs. Valuable	5.62	1.22
Trivial vs. Fundamental	4.74	1.49
Not beneficial vs. Beneficial	5.49	1.15
Does not matter to me vs. Matters to me	4.40	1.24
Uninterested vs. Interested	5.46	0.97
Insignificant vs. Significant	5.46	1.11
Superfluous vs. Vital	5.38	1.07
Boring vs. Interesting	5.67	1.02
Unexciting vs. Exciting	5.87	0.86
Unappealing vs. Appealing	5.27	1.23
Mundane vs. Fascinating	5.49	1.16
Nonessential vs. Essential	5.55	1.25
Undesirable vs. Desirable	5.12	1.27
Unwanted vs. Wanted	5.58	1.06
Not needed vs. Needed	5.87	1.07
Total mean score	109.78*	

Note: * The PII range: from 20 to 69 (low); from 70 to 110 (medium); from 111 to 140 (high)

related to the respondents' involvement in their visits to the locations.

DISCUSSION AND CONCLUSIONS

The main objective of this study was to examine influence of the movie *The Sound of Music* in respondents' travel decisions to Salzburg, Austria, where the movie was filmed. This study suggests that the movie can be an influential factor to attract visitors to the film locations. When respondents were asked to what extent the movie affected their trip to Salzburg, more than half of respondents agreed following statements: 'The movie has influenced me to visit Salzburg' (52.8%), 'After I had seen the movie, I has always wanted to visit the film locations' (62.7%), and 'Once I had seen the movie, I had to come to Salzburg' (56.7%). The findings also support those of several studies on the phenomenon that films encourage tourism to destinations and would consider traveling to film locations in the future (e.g., Busby & Klug, 2001; Kim et al., 2006; Warnick et al., 2005). With respect to impact of the movie between those who had seen the movie and those who had not seen the movie, respondents who were exposed to the movie were more likely to be influenced by the movie than those who were not exposed to the movie in intention to visit the film locations. These results are different from those of Warnick et al.'s study (2005), which reported no significant differences between those two groups on the likelihood to visit Thailand.

Another indication of a significant role of the movie can be found in relationship between frequency of watching the movie and travel decisions. The results show that respondents with viewing the movie more than six times tended to be more heavily influenced than those who had not seen the movie in visitation decisions, particularly, relating to intention to visit Salzburg. In tourism literature, familiarity including actual or previous visitation has been found to be an important factor influencing visitors' decision-making process (i.e., Baloglu

& Mangalolu, 2001; Dann, 1996; Hu and Ritchie, 1993; Andereck, 2005). Likewise, Gyte and Phelps (1989) confirmed that a previous visit played a critical role in attracting tourists to revisit the destination. In this sense, the results of the study confirmed that movies familiarize audiences with places and attractions featured in them, thus, observing a movie can increase the degree of familiarity with the places it portrays (Kim and Richardson, 2003; Riley and Van Doren, 1992). In addition, this study supported that film has become a dominant source of information (Macionis, 2004) by identifying the movie as major information source heavily used by respondents in planning a trip to Salzburg. Finally, with respect to demographic profiles, majority of the respondents held a higher-level educational background (70.8%) with a relatively higher disposable income than normal, ranging between US\$70K and above (34.7%). Busby and Klug's study in 2001 partly support these results by arguing that cultural tourists tend to be affluent older professionals and senior managers. Further analyses on demographic differences in travel decisions confirmed that older people tended to be more influenced than other age groups by the movie in visitation decisions.

In conclusion, it is clear that more researches are needed to document this largely unexplored phenomenon by investigating various movies at different locations. Further efforts should be made to investigate the influence of movies in terms of motivational and behavioral aspects. It is critical for local film commissioners and tourism marketers to conduct a research to assess the secondary economic effect of tourist spending generated from visitation to movie locations in order to utilize the movies as valuable tourism publicity and promotion tools. It is also recommended that research related to the various tourism impacts created by movies in both positive and negative should be conducted. Although it is widely known phenomenon that movies influence the travel preference and destination choices of visitors in terms of visitor increase, this

movie-induced tourism cannot always create positive impacts, particularly, on a local community. One limitation of this study is that the subjects of the survey were limited to English-speaking tourists only because the survey instrument was developed in English. As a consequence, the survey was mainly completed by subjects who resided in North America including Canada and USA, and Oceania (Australia and New Zealand). The results of the survey, therefore, may not reflect the whole body of the visitors under the study. Another limitation is that the data collected was based on the movie *The Sound of Music* and "Salzburg, Austria" only. Therefore, implications may or may not apply to different movies and their film locations.
